Introducing the new standard in training simulations:

## Moving target system MTS

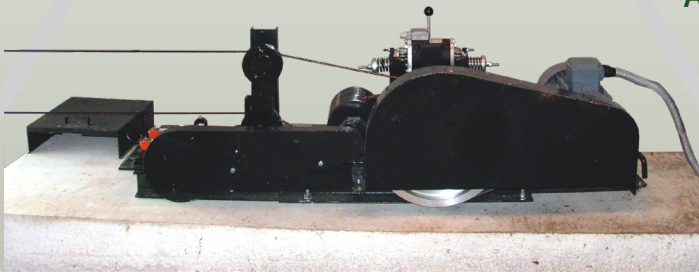

The MTS system is the professional facility of modern training simulation areas. This system using up to 3 wagons on the short part of railway to simulate real-based situations. MTS control part is equipped with special drivesystem to ensure durability and precise operation. Control and communication are based on the LonWorks control system. This network technology allows complete enhanced operating and monitoring exclusively through existing power infrastructure, which also supplies the device. Wireless communication are also possible.

### Versatile usage

- integrating of big target pop-up VTZ\_TI on the wagons
- simulation of moving targets with various target movements

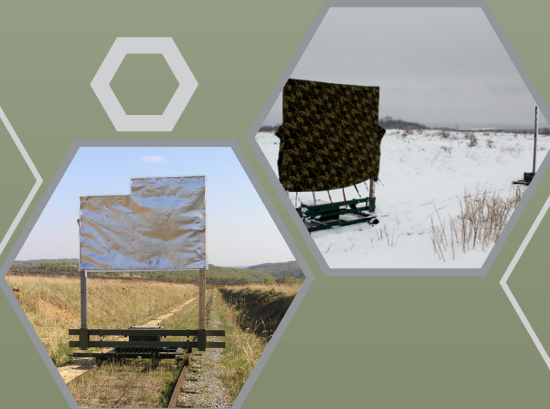

### Accessories

- up to 3 wagons with full-featured big target pop-up
- detonator, safflower and smoke shell connection
- external infrared remote controller for testing
- external RF controller in case of wireless operation

### Easy to use

- complete installation with integrated switchboard and control
- compatible with big target pop-up VTZ\_TI
- using existing power line network
- possible usage of motor generator in the area without electricity
